

A few tests

Here are some types and terms:

```
(:num)
(:α)
n + 1
[1; 2; 3; n; m + 1]
P (SUC n) ∧ q
```

Here are some theorems:

```
⊢ (MAP s (get_live code live) = MAP t (get_live code live)) ⇒
  (MAP (eval f s code) live = MAP (eval f t code) live)
⊢ colouring_ok c code live ∧ no_dead_code code live ∧
  (MAP s (get_live code live) =
    MAP (t o c) (get_live code live)) ⇒
  (MAP (eval f s code) live =
    MAP (eval f t (apply c code) o c) live)
```

Something from colouring:

```
⊢ duplicate_free live ⇒
  colouring_satisfactory c (get_conflicts code live) ⇒
  colouring_ok_alt c code live
```
